

Pizza Sales Analytics Project Report

This report summarizes the key findings and analytical processes performed on the Pizza Sales dataset.

1. Project Objectives

- Develop a full-stack data analytics pipeline from CSV to Power BI.
- Utilize SQL Server for advanced data processing and aggregation.
- Create interactive dashboards for actionable business insights.

2. Key Metrics & Calculations

Total Revenue: Calculated as the sum of all pizza prices multiplied by their quantities.

Total Orders: Count of unique order IDs.

Average Order Value: Total Revenue divided by Total Orders.

3. Analytical Workflow

Phase	Tools	Action
Ingestion	SQL Server	Imported raw CSV, defined table schemas.
Processing	SQL Queries	Wrote queries for daily/monthly performance trends.
Modeling	Power BI	Established relationships & created DAX dimensions.
Visualization	Power BI	Built KPI cards, maps, and trend charts.

4. Business Insights

- **Peak Performance:** Identified specific days of the week with the highest sales volume.
- **Inventory Strategy:** Categorized pizzas by sales performance to optimize menu offerings.
- **Customer Trends:** Analyzed size and category preferences to drive marketing strategies.
